```

ip route

```
-add or delete a ip route permenantly or temprorary
```

dns setting

```
-change machine DNS IP
-backup or restore DNS config
```

How to use it:

It doesn`t take you any special effort to use it. You just need to give execution access to the file and then run it at the root user stage. The Provided CLI Menus are fully-understandable and by the features section you are able to find what at what submenu.

What you need to do is only execute this command at the project folder with root privilage:

```
make run
```

Feel free to use it and if there is any problem contact me with:
